

## Setting Up Your Database

# Setting up your database

Defog lets user query data in your structured databases in natural language. To get started, you need to set up your database and metadata.

**i** Defog never gets access to the actual data in your database. It only extracts the metadata, including table names, column names and column descriptions, to generate accurate results.

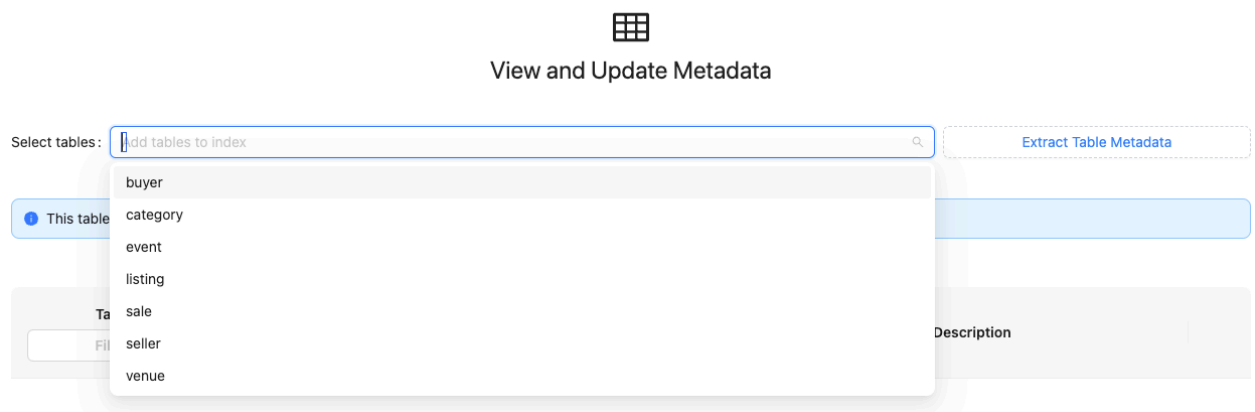

## 1 Add database credentials #

To add your database credentials, go to **Manage Database** in the top navbar. Click on **Update Database Credentials** and fill in the details.

## 2 Extract metadata

Once you have added your database credentials, click on the **Extract Metadata** tab to extract the metadata from your database.

Use the dropdown to select all the tables in your database that you want to make queryable and click on **Extract Table Metadata**.

## 3 Review and save metadata

Review the extracted metadata. If no column descriptions were extracted, you may wish to add column descriptions. You can view our [cookbook on schema definitions](#) for tips on how to define column descriptions.

We have seen a **90+% reduction** in query errors when customers define their schemas well!

Click on **Save Changes** once you have reviewed and/or added column descriptions.
