

Slack Integration

Using Defog's Slack Integration

You can easily integrate Defog with your Slack workspace. This allows you to ask questions and get answers from your database without leaving Slack.

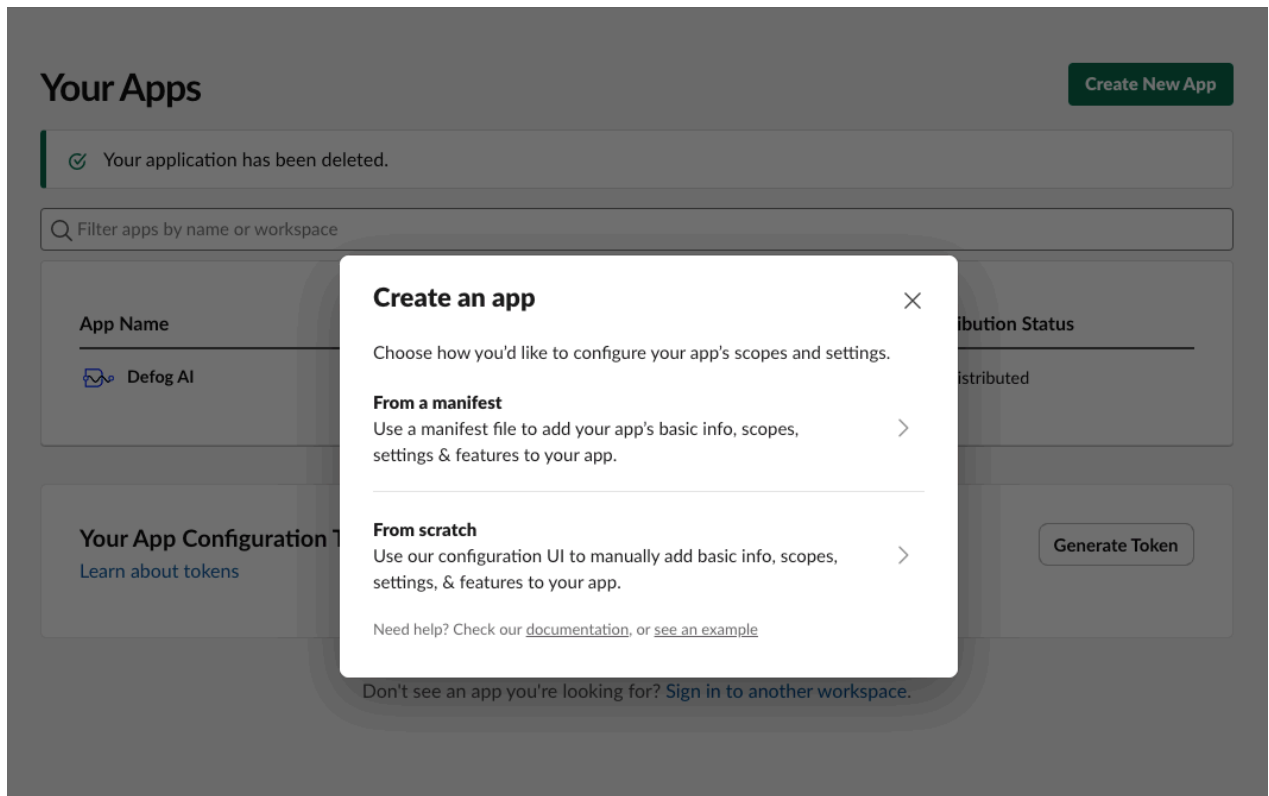

1 Start your docker image, and ensure that it is publicly accessible via an HTTPS API

This step is crucial, as Slack does not allow connections to HTTP endpoints or to private IPs. You can use a VPN or a service like [ngrok](https://ngrok.com) to expose your local server to the internet.

2 Go to api.slack.com, and create a new Slack bot by clicking on "Create New App"

Go to Slack's API page at <https://api.slack.com>, and create a new Slack bot by clicking on "Create New App".

3 Select the "From Manifest" option, and select the workspace you want to install it in

4 Select the **YAML** option, and paste the following string.

Remember to change the `YOUR-DEFOG-DOMAIN` bit below to the HTTPS domain where your docker image is running.

```
display_information:
  name: Defog AI
features:
  bot_user:
    display_name: Defog AI
    always_online: true
oauth_config:
  scopes:
    user:
      - users:read
  bot:
    - chat:write
    - files:write
    - im:history
    - im:read
    - mpim:history
    - mpim:read
    - users:read
```

```
    - users:read.email
    - chat:write.public
settings:
  event_subscriptions:
    request_url: YOUR-DEFOG-DOMAIN/slack/events
    bot_events:
      - message.im
      - message.mpim
  interactivity:
    is_enabled: true
    request_url: YOUR-DEFOG-DOMAIN/slack/interactions
  org_deploy_enabled: false
  socket_mode_enabled: false
  token_rotation_enabled: false
```

5 Install the app in your workspace

Next, go to the OAuth & Permissions page, and install the app to your Workspace.

Then, copy the `Bot User OAuth Token` and use its value for the `SLACK_BOT_TOKEN` variable inside the `.env` file of your `defog-docker` project.

6 Restart your docker image

Restart your docker image with this new env variable added in (in production), using

```
docker compose up --detach
```

7 Start chatting with Defog in Slack

Note that only users whose email ids have been added to Defog will be able to ask questions.

After this, you should be able to simply ask a question straight from Slack by going to the app and messaging with it. You will have to ensure that the email id you are using to ask questions is added to Defog, using the [Manage Users](#) option.
